FREECOOLING

# Turbocor oil-free compressors

Excellent energy efficiency: save up to **25%** in operating costs\*

Turbocor compressors offer the outstanding energy savings from digitally controlled, frictionless two-stage centrifugal compression and guarantees significant reductions in operating cost and environmental emissions associated with energy production.

The oil-free design of Turbocor compressors eliminates the potential for efficiency robbing oil contamination and all of the oil management accessories: oil heaters, oil pumps, oil separators, oil filters, plus oil disposal.

Compressor soft-start draws only 2 amps and reduces mechanical stress, as well as the electrodynamic stresses on the power cables and electrical distribution network, extending the overall lifespan of the system.

\* compared to leading competitor screw chiller over an annual running in Nuremberg, Germany

Lightstream

## Advanced control software

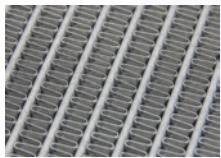

The control hub of Lightstream Turbo chillers is a sophisticated controller and advanced software developed for efficient operation of Turbocor-based chillers. It manages and optimizes the chiller's performance, giving the complete control over the system for plant operator.

For the efficient operation of multiple units on a single chilled water plant, the sequencing software permits interlinked operation of the complete system, thus providing optimal temperature control and minimal energy consumption.

# ● Microchannel condensing coils

Better heat transfer. Lower condensing temperatures. Higher efficiency.

Microchannel condensers used in Lightstream Turbo design give a number of advantages, including higher heat transfer rate, low airside pressure drops, and closer approach temperatures. The end result is up to 40% higher energy efficiency in comparison to traditional fin/tube heat exchanger design.

Smaller coil face, thin design, up to 50% less weight, and less refrigerant charge translate to lower system cost. Microchannel condensers used in Lightstream Turbo chillers are true HVAC coils developed and optimized especially for refrigeration applications and enable remarkable low condensing temperatures.

AVAILABLE

## High-efficient solution

Extra condenser sections in H-series models

Lightstream Turbo H-series chillers feature extra condenser banks which enable lower condensing temperatures, 15% higher energy efficiency rates (EER) compared to standard Lightstream Turbo models and reduced noise emission level.

# Intelligent fan system

EC-type fans with reduced power consumption

Lighstream Turbo's new generation fan system not only reduces power consumption by up to 30% while easily managing the extraordinary high volume flows – it also works at much reduced operating noise.

The smart fan system includes the unique fans with bionic wing concept, the most advanced EC motor technology, and multifunctional air diffusers, resulting in an extra economic efficiency for the customers.

EC motor technology does not provide savings only during full-load operation - it is exactly when operating under partial load that EC motors lose much less of their efficiency.

ENERGY EFFICIENCY  
UP TO

**4.30**

Coolant temperatures: 10/15°C; Ambient temperature: 35°C

## Flooded evaporator

The flooded evaporator enables to operate at the higher saturated evaporating temperature when compared to many others evaporator types and allows achieving higher cooling capacity with correspondingly higher efficiency.

The refrigerant pool behaves as a flywheel, allowing the controls of the flooded evaporator to track the varying load of a batch process, while optimized tube geometry ensures optimal refrigerant distribution.

# Freecooling

## Generates energy savings all year round

The Lightstream Turbo chillers can supply chilled water with fairly high temperatures, thus maximizing the amount of time the system can produce chilled water without running mechanical cooling mode. Compared to conventional chillers, Lightstream Turbo equipped with freecooling system generates the energy savings of up to 50% and return the investments within a short timeframe.

When running in concurrent freecooling and mechanical cooling mode, the control system constantly monitors the condensing temperature and keep it within the compressor envelope to allow the maximum possible fan speed and achieve the most freecooling. During the periods when the fan speed must be reduced to a minimum, the chilled water temperature is controlled via motorized valves.

## Model identification

Lightstream Turbo		T	800	F	6	/	1	-	F

	H	High-efficient condensers							

## R1234ze

### Low-GWP refrigerant option

Refrigerants with low global warming potential (GWP) are becoming more and more important in the refrigeration and air conditioning industry in Europe and beyond.

R1234ze features low GWP of one and zero ozone depletion potential, thus providing the environmental leadership while achieving the best energy performance levels for applications.

Lightstream Turbo has been designed for year-round mission-critical service in data centers, telecom facilities, and process cooling applications. Low noise emission also enables Lightstream Turbo to be used in noise-sensitive environments such as inner cities, hospitals, etc.

Due to its excellent efficiency at part-load conditions, Lightstream Turbo is an excellent economy solution for applications where the heat load is not constant and/or expected to grow.

The synergy of modern technology, efficiency and reliability enables Lightstream Turbo to be used in the most demanding applications.
